Verb class effects on word order: Evidence from a comparative corpus study

Elisabeth Verhoeven
elisabeth.verhoeven@cms.hu-berlin.de
Introduction

Experiencer-first effects:

accusative-first orders

evidence from several languages and different types of data: Lenerz 1997; Belletti & Rizzi 1998; Anagnostopoulou 1999; Scheepers 1997; Haupt et al. 2008, etc.

choice of a lower argument as subject (non-active voice)

evidence from production studies; Ferreira 1994, Lamers & De Hoop (forth.)

Phenomena of the former – but not of the latter – type

*can* be reflexes of the basic syntactic configuration.
Introduction

Questions

Does the verb class has a genuine effect on word order or is this effect fully explained by independent factors – either contextual (givenness) or inherent (animacy)?

A. Is there an experiencer-first effect and if yes, is it independent from further semantic and pragmatic factors?

B. Is the frequency of non-canonical orders with experiencer-object verbs part of a general preference for the earlier realization of experiencers?

C. There are several subclasses of experiencer object verbs depending on case (accusative, dative) or agentivity of the actor (agentive, non-agentive). Which distinction is relevant for the linearization properties?
Introduction

What do we expect to learn from cross-linguistic comparisons?

Languages differ with respect to
- the syntactic operations that allow for different linearizations
  - OS through scrambling in German
  - OS through left-dislocation in Chinese
  - OS through clitic left-dislocation in Greek
- semantics of non-active voice (which restricts its use as a linearization option)
  - reflexives (German)/mediopassives (Greek) and stativity

Comparing languages is informative

_for the type of syntactic operation that is sensitive to experiencer-first effects._
Contents

Word order frequencies with different verb classes in corpora

German

Does the verb class has a genuine effect on word order or is this effect fully explained by independent factors – such as animacy?

Language comparison

Scrambling in German vs. left dislocation in Greek/Chinese
German: Corpus study

**corpus**
- W-öffentlich of COSMAS database, Written Language,
- 2,291,520,000 word forms

**extracted**
- 10 verbs for every verb class (four verb classes)
- 1000 tokens per verb (randomized): total 40000 tokens
  (background: verb as random factor)

**valid tokens**
- main clauses with two realized arguments (pronouns excluded due to particular rules in German)
- total: 40,000; valid: 4319

**decoding**
- order: SO vs. OS
- voice: active vs. non-active
- field: $X_{\text{fin}}Y$ (prefield), $V_{\text{fin}}XY$ (middlefield)
- definiteness: definite vs. indefinite
- animacy: animate vs. inanimate
Verb classes

Canonical transitive verbs

beeinträchtigen ‘impair’, behindern ‘hinder’, schützen ‘protect’, etc.
(particular subclass of canonical verbs with include animacy configurations similar to EO verbs; the question is whether EO effects are restricted to experiencers and not to achieve generalizations about the behaviour of all canonical transitive verbs)

Dative Experiencer-Object verbs

imponieren ‘impress’, gefallen ‘please’, widerstreben ‘be reluctant’, etc.

Accusative Experiencer-Object ±agentive verbs

nerven ‘bother’, überraschen ‘surprise’, ärgern ‘annoy’, etc.

Accusative Experiencer-Object non-agentive verbs

interessieren ‘concern’, wundern ‘astonish’, freuen ‘give pleasure’, etc.
Choice of order
Questions

A. Do **verb classes** have an **influence on word order**?
   A1. (If yes) is this influence independent from other factors (animacy/definiteness)?
   A2. (If yes) where is the locus of the influence?
      - thematic relation of the **undergoer**: patient vs. experiencer
      - thematic properties of the **actor**: agentive/non-agentive
      - **case**: dative vs. accusative

<table>
<thead>

Comparison of all models (fourfold, threefold, twofold contrasts) reveals that the maximal goodness of fit is reached by "Canonical vs. E.ACC vs. E.DAT" (Log-likelihood test comparing this model with the full model: not significant).

Calculations with the function `glmer` of the R-package `lme4` (Bates et al. 2011)
Results II: confirmed effects

definiteness

main effect and interaction effects not statistically confirmed (LLT: not significant).

verb class: animacy

log-likelihood test: $\chi^2(2) = 13.4, p < .01$

canonical verbs: no animacy effect
EO.ACC: experiencer fronting with disharmonic animacy
EO.DAT: experiencer fronting independent of animacy

source of the case effect: blocking effect with ACC&harmonic

verb class: field

log-likelihood test: $\chi^2(2) = 13.9, p < .001$

larger effects of class in the middlefield than in the prefíeld

relevance: assumptions about German syntax; previous findings (Bader & Häussler 2010)

animacy: field

log-likelihood test: $\chi^2 (1) = 9.1, p < .01$

larger effect of disharmonic animacy in the middlefield.
Choice of subject
Questions

B. Do **verb classes** have an **influence on the choice of subject**?
   B1. Independence from other factors
   B2. Locus of influence

**Relevance of this question**

If the linearization effect relates to a general preference for realizing the experiencer early in the utterance, it should be equally manifested in alternative structures:
   - fronting the EO.
   - choosing an ES construction.
Cases of interest

actor subject

Die Profis enttäuschten die Fans.
'The professional players disappointed the fans.'

undergoer subject

Die Fans wurden / waren von den Profis enttäuscht.
'The fans were disappointed by the professional players.'
Animacy and choice of subject

Non-active verb forms
(total = 3155 clauses)
Results: verb-class contrasts

<table>
<thead>
<tr>
<th>AIC</th>
<th>patient</th>
<th>experiencer</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>± agentive</td>
<td>non-agentive</td>
</tr>
<tr>
<td>3150.7</td>
<td>$\alpha$</td>
<td>$\beta$</td>
</tr>
<tr>
<td>3152.2</td>
<td>$\alpha$</td>
<td>$\beta$</td>
</tr>
</tbody>
</table>

Comparison of all models (threefold, twofold contrasts) reveals that the maximal goodness of fit is reached by "± agentive vs. non-agentive" (Log-likelihood test comparing this model with the full model: not significant).

**verb class: animacy**

log-likelihood test: $\chi^2(1) = 7.9$, $p < .01$

source of this effect: non-agentive verbs display high proportions of non-active voice across animacy levels
Comparative corpus study
## Greek and Chinese

| **corpus** | Chinese: *CCL* Corpus; 264 444 436 Modern Chinese characters, 84 127 123 Old Chinese characters;  
|            | Greek: Hellenic National Corpus, ILSP, 47.000.000 words |
| **extracted** | 10 verbs for every verb class (two verb classes)  
|             | 250 tokens per verb (randomized): total 5000 tokens  
|             | (background: verb as random factor) |
| **valid tokens** | main clauses with two lexical arguments  
|               | Chinese; valid: 640  
|               | Greek; valid: 701 |
| **decoding** | order: SO vs. OS  
|              | voice: active vs. non-active  
|              | definiteness: definite vs. indefinite  
|              | animacy: animate vs. inanimate  
|              | clitic doubling (Greek) |
Object-first orders: Greek

Clitic left-dislocation

\[ \text{tin} \quad \text{maría} \quad \text{tin} \]

DEF:ACC.SG.F  Maria:ACC.SG.F  3.SG.ACC.F

\[ \text{enoxlí} \quad \text{o} \quad \text{pétros.} \]

bother:3.SG  DEF:NOM.SG.M  Peter:NOM.SG.M

‘Petros bothers Maria.’

Discourse triggers for clitic left-dislocation:

- with EO verbs: obligatory according to intuitions (Anagnostopoulou 1999), not confirmed in corpus (Verhoeven 2009) or acceptability experiments (Temme & Verhoeven 2014)
Object-first orders: Chinese

Left dislocation

Zhāngsān   wǒ   yǐjīng   jiàn   guo   le
Zhangsan  1.SG  already  see  EXP  CRS
‘Zhangsan, I have already seen him.’ (see Li and Thompson, 1981:15)

Discourse triggers for left-dislocation in Chinese:
-Left-dislocated objects occur as hanging topics (see Huang et al. 2009, Li and Thompson, 1981)
-Rare in speech production (1 OSV out of 397 clauses with two lexical arguments in Verhoeven 2014)

Object-fronting in languages with left-dislocation is more rare than object-fronting in scrambling languages, vgl. German, 222 Accusative-first out of 1712 clauses, 13% (across verb classes and animacy levels).
Non-active forms

Chinese

*Kèrén bèi tāng mízhù.*

guest BEI soup attract

‘The guest is enticed by the soup.’

Greek

*i maría enoxlíte*

DEF:NOM.SG.F Maria:NOM.SG.F bother:MEDIOPASS.3.SG

*apó ton pétro.*

by DEF:ACC.SG.M Peter:ACC.SG.M

‘Petros bothers Maria.’
Choice of subject

Greek
(valid = 701)

Interaction, LLT, $\chi^2(1) = 4.2, p < .05$

Chinese
(valid = 640)

Interaction, LLT, $\chi^2(1) = 7.2, p < .01$
Conclusions
Conclusions

**Word order**

Experiencer-first triggers scrambling in German, but not left-dislocation in Greek/Chinese.

In particular for German: difference between canonical and EO verbs; additional effect of case (with ACC blocking fronting under harmonic animacy)

**Choice of subject**

Animacy and verb class interact in all languages such that the contrast between animacy levels is smaller for EO verbs. Differences in magnitude may be due to differences in the semantics of non-active forms.

high frequency in German: non-compensatory effects with word order
Supplementary material
Verb classes

Canonical transitive verbs

beeinträchtigen, behindern, blenden, infizieren, heilen, retten, schützen, vergiften, wecken, zerquetschen

Dative Experiencer-Object verbs

imponieren, auffallen, behagen, einfallen, entfallen, gefallen, leidtun, missfallen, entgehen, widerstreben

Accusative Experiencer-Object ±agentive verbs

nerven, überraschen, ärger, erschrecken, reizen, langweilen, amüsieren, irritieren, aufregen, enttäuschen

Accusative Experiencer-Object non-agentive verbs

interessieren, wundern, freuen, befremden, bedrücken, entsetzen, ekeln, faszinieren, empören, anwidern

Table 1. Categories in the corpus
Verb classes and agentivity

Agentivity test frame with control verbs:

\(X \text{ entschied, } Y \text{ zu } V \text{ ', } X \text{ decided to } V \text{ Y'}\)

scalar acceptability judgments

(1: non-acceptable; 7: acceptable)

\(n\) of speakers: 32
Corpus study: EO verbs

Is agentivity a good predictor for the choice of OS in the middle field?

\[ y = -0.1049x + 0.9065 \]

Pearson \( R = -0.45 \)
Corpus study: EO verbs

Two generalized mixed logit models on the data with ACC EO verbs argument order $\sim$ verb class (fixed factor); verb (random factor)

(a) verb class = factor with two levels
(b) verb class = interval-scaled factor

(a) two-levels model (+-agentive vs. non-agentive):

Akaike Information Criterion: 173.02

(b) scalar model:

Akaike Information Criterion: 172.16
Results (plotted for definiteness levels)
